**DISC BRAKE PADS**

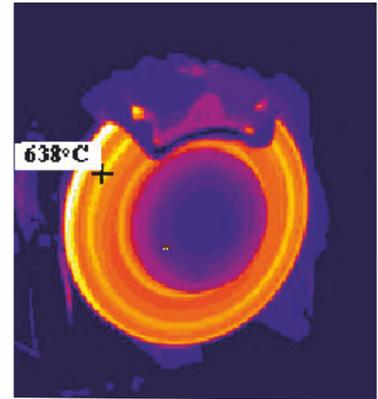

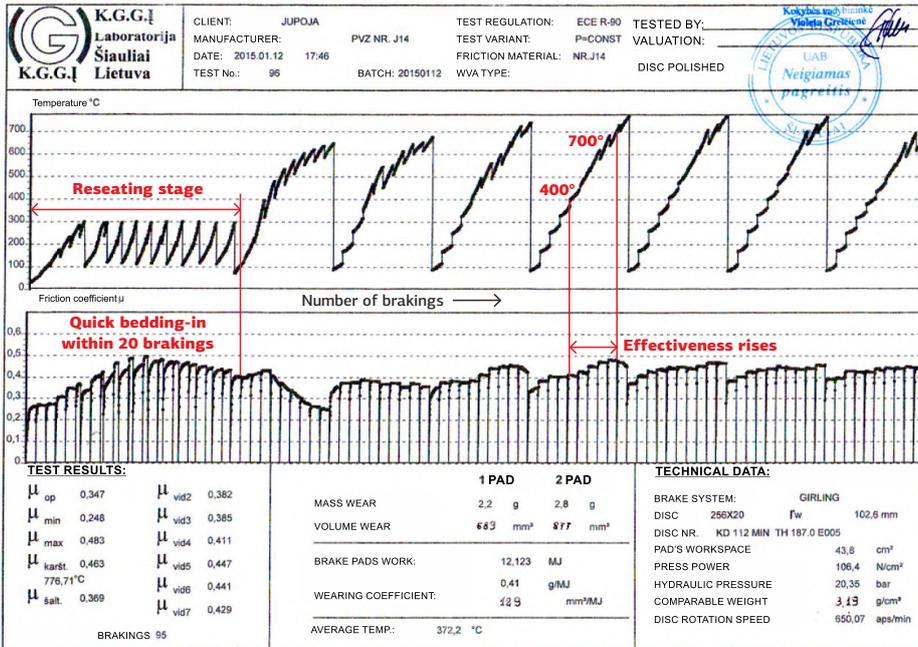

“O.E.M and other manufacturers names, part numbers and images are used for reference only”

## PREMIUM CLASS BRAKE PADS

To make sure of the quality and not to disappoint Customers, brake pads are tested by accredited testing laboratory performing the test on the basis of the engineer Peter Krauss method. All pads are always tested in identical conditions - the contact area, the pressing force, the disk rotation speed are always the same. The obtained data (material wear, abrasion and friction coefficients, the operating temperature, the impact on disc) is analysed and the comparative results are presented.

One of the main characteristics - the friction coefficient curve - shows the change of braking efficiency when braking conditions become more difficult, when the braking temperature rises. When braking on highway from 100 km/h to a full stop pads heat up to 500°C; in the mountains even more.

### Other test results

Compared with other manufacturers' pads under the same conditions, RW Premium pads:

ξ **don't grind the disc** - surface remains specular

ξ **minimal noise**

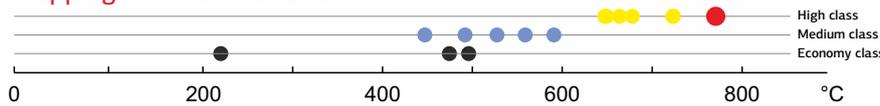

ξ **Braking efficiency increases** with the rise of working temperature - important on highways and mountains

ξ Due to the good abrasion coefficient Roadwin pads **longevity equals** accepted producer pads

ξ New pads **quickly bed-in** and achieve the best working performance

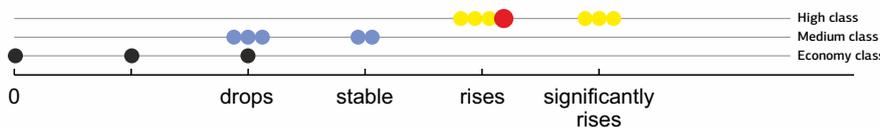

### Maximum work temperature

The higher the working temperature, the better the pads brake and the **stopping distance is shorter**

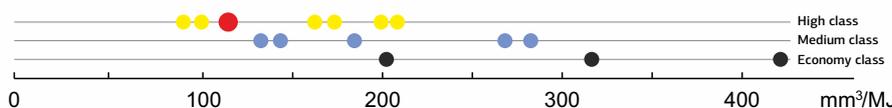

### Braking effectiveness

If the friction coefficient with increasing temperature rises, **the braking is improving** in difficult conditions, for example, driving down the hill

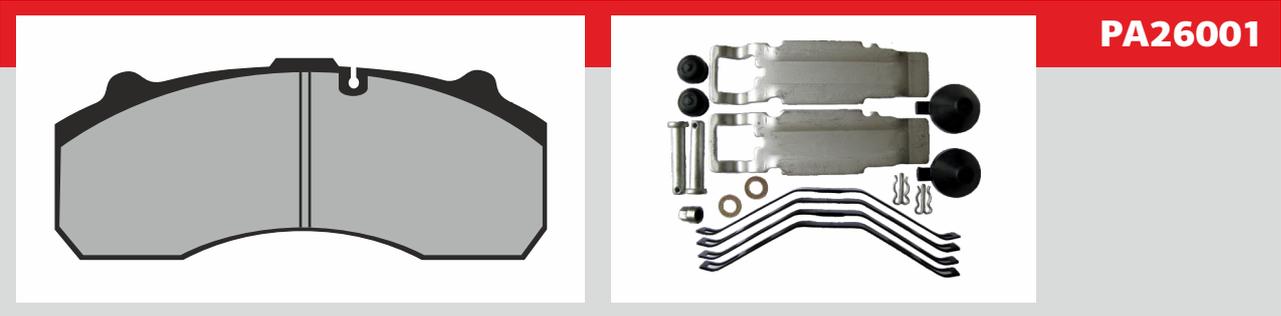

### Low rate of wear

Lower the rate is, **less the pads wear and last longer**

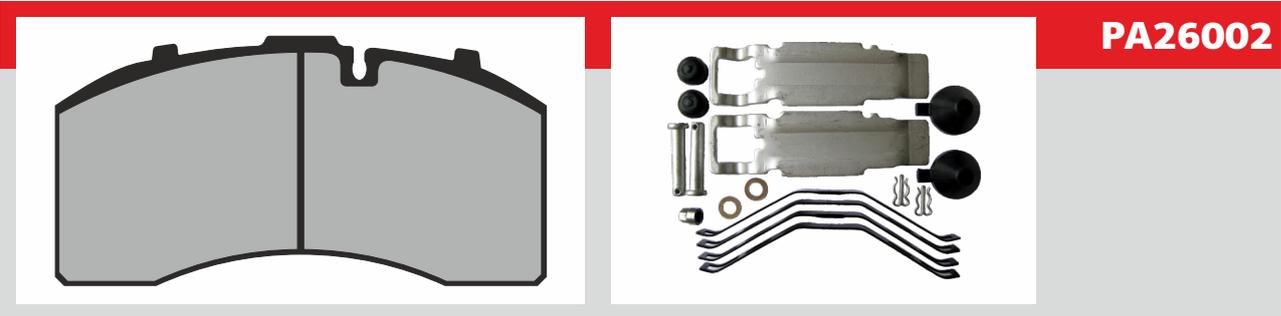

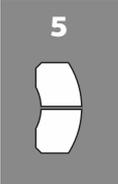

- ROADWIN PREMIUM brake pads
- High class brake pads, made by well-known accepted manufacturers
- Medium class brake pads
- Cheap, economy class brake pads
